THE REVOLUTIONARY NEW PRODUCT WITH THREE-WAY ACTION

Micro-Con

• BACTERIA • HUMIC ACID • SEAWEED EXTRACT •

MICRO-CON is a dry, soluble, and organic micronutrient concentration developed by combining three basic but very beneficial ingredients which result in an increase in production and pathogenic resistance.

The first ingredient in **MICRO-CON** is a specialized formulation of bacteria. The various bacteria used in the formulation were chosen for their ability to: break down the nutrients in the soil (making them more readily available to the plant); their nitrogen-fixing capabilities; and their ability to produce polysaccharides (the building blocks of soil structure).

These bacteria work in conjunction with each other to improve soil structure. Better soil structure means more water retention capabilities, less leaching of nutrients, better aeration of the soil and faster uptake of nutrients by the plants. The result is faster growing plants with increased disease resistance.

The second ingredient found in **MICRO-CON** is humic acid. Humic acid is the most concentrated form of organic material found on earth. It is derived from leonardite which is formed from thousands of years of decaying plant and animal matter. Humic acid is not an acid in the traditional sense because it is not soluble in water and it has a neutral pH. When it is applied to the soil it chelates with the nutrients in the soil helping to stop their leaching and making them more readily available to the plant. Adding humic acid to the soil is the easiest and most effective way to add organic material to the soil.

The third ingredient in **MICRO-CON** is pure, concentrated seaweed extract which contains very high

concentrations of naturally occurring growth hormones and growth regulators. These growth enhancers help the plant grow stronger and faster as well as increase flowering and fruit production.

MICRO-CON is the only product of its kind on the market today that actually helps reverse the soil deterioration common in traditional farming techniques and eliminates the need to apply harmful chemicals to the soil. The constant application of currently used chemical fertilizers results in the deterioration of the soil's structure. These chemicals that destroy plant pests and pathogens also destroy the beneficial microbial activity necessary

for healthy soil.

MICRO-CON is formulated to be mixed with your current dry fertilizer at the rate of 5 kilos per hectare. **MICRO-CON** can be applied to any crop to increase flowering, production, growth rate, and to drastically improve soil structure, nutrient uptake and water retention. It will also help to control nematodes and after several applications should alleviate this problem completely (depending on conditions).

MICRO-CON is not a fertilizer, it is however, a concentrated formulation that adds the many necessary elements required to establish and maintain a healthy soil and crop. **MICRO-CON** will not harm plants even if applied in excessive amounts.

MICRO-CON will recondition and rejuvenate the soil while increasing productivity and pathogenic resistance **NATURALLY & ORGANICALLY.**
